

Citation Integrity Audit

Research Topic

A Taxonomy of Hallucination Types in Large Language Models for Research Applications

Student Information

Name: Umakant Singh

Institution: Indian Institute of Information Technology Allahabad (IIIT Allahabad)

Academic Status: M.Tech (IT-NSC), 1st Year

1. Purpose of the Audit

This citation-integrity audit was conducted to verify the scholarly references included in the research work on hallucinations in Large Language Models (LLMs).

The purpose of the audit was to ensure that the references are genuine, relevant to the research topic, bibliographically accurate, and linked to the correct scholarly sources.

2. Verification Criteria

Each reference was checked using the following criteria:

1. Correct paper title
 2. Correct authors
 3. Correct publication year
 4. Correct journal, conference, or publication venue
 5. DOI, where available
 6. Confirmation that the paper genuinely exists
 7. Confirmation that the provided link corresponds to the intended paper
-

3. Verification Process

Potential research papers were initially identified with the assistance of AI-based research tools and scholarly searches.

Each candidate reference was then independently cross-checked using authoritative academic sources, including publisher pages, DOI/Crossref records, ACL Anthology, Google Scholar, Semantic Scholar, and other appropriate scholarly databases.

The bibliographic information and paper links were compared with the information available from the relevant scholarly source before the paper was included in the final research collection.

4. Verification Results

The references included in the final repository were reviewed for bibliographic accuracy and relevance.

The verification process confirmed the following:

- Paper titles were checked.
 - Author information was checked.
 - Publication years were checked.
 - Journal or conference information was checked.
 - DOI information was checked where available.
 - The existence of the cited papers was confirmed.
 - Paper links were checked against the corresponding papers.
 - The relevance of each paper to LLM hallucination research was considered before inclusion.
-

5. Corrections Identified During Verification

During the cross-verification process, **two incorrect paper links were identified.**

The incorrect links were corrected and then checked again to ensure that each corrected link points to the intended scholarly paper.

This correction process helped improve the accuracy and reliability of the final reference collection.

6. Final Verification Status

After completing the cross-verification process, the research references included in the repository were reviewed again before being finalized.

The final collection contains **20 unique scholarly papers** related to the research topic, organized according to meaningful research areas such as:

- Survey and Review Papers
 - Foundational Papers
 - Recent Research Papers
 - Methods and Algorithms
 - Applications
 - Evaluation Methods and Benchmarks
-

7. Use of Generative AI

Generative AI was used as an assistance tool for discovering potential research resources and organizing research material.

However, references were **not accepted solely because they were suggested by an AI system**. Each reference was independently checked against scholarly or authoritative sources before being included in the repository.

8. Conclusion

The citation-integrity audit was performed to improve the reliability, accuracy, and traceability of the research references used in this project.

Two incorrect links were identified and corrected during the verification process. The final references were cross-checked after these corrections and organized according to their relevance to the study of hallucinations in Large Language Models for research applications.
